

Objectives to Work on Before Next Meeting

Mechanical Engineering - Pep, Roshan, Lily

1.0 - Designing Parts

- **1.1** - Pep: Work on the Nozzle Part connection, how we will connect the nozzle to the mount, such that it rotates
- **1.2** - Roshan: The gear system we already have the one part of the gear designed so you can either design another one that links and then the inner whole matches diameter of the servo so we can screw on our if it is easier just design 2 interlocking ones such that we can then test it and just add it onto the nozzle afterwards with some minor adjustments
- **1.3** - Lily: The servo holder, design the holder that is the dimensions of the servo, that basically just has a bottom/top plate for the servo to rest on, and then the rest of the servo is fit snug in the actual "tray."

Deliverable: Have these designs done so we can print and then test next meeting

Software & Electrical - Ayaam & Vivienne

1.0 - Look into how to run the servos off this and test them, so we can then test our gear mechanism. Look into this vehicle design's exact support for flight, and then also look at the sensor calibration for this. Also can look at the power pin issue for this.
